Hosting and data center services

Since its founding in 1999 credativ is one of the few companies which has exclusively focused on services and support for Open Source software.

Many of our technical employees actively participate in international Open Source projects and are a part of the worldwide developer community for Open Source software. credativ supports several Open Source projects that play an important role in IT infrastructure.

One of our key business areas are operation and operation support. We can even take over operations completely for environments based on Linux, where countless Open Source components are used.

Our operational support is handled by an experienced team of Open Source specialists and it fully covers all daily operation tasks. Make use of our team to compensate for peak loads or absence in case of illness.

We can either work alongside your inhouse team to assist with top-tier support queries, or take over responsibility for your systems entirely. If required, your operations can also be outsourced to an external data center.

Popular services of our Operations Center:

- Administration
- Software management
- Patch management
- Packaging
- Deployments
