

PostgreSQL Competence Center

The best-developed Open Source database system

Stable and reliable

Easily scalable

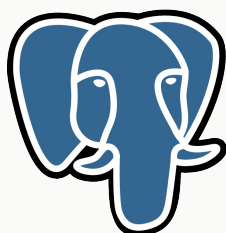

High performance

Total transaction security

Cross-platform

Quality assured by an international team of developers with over 15 years' experience

No licence fees

What is PostgreSQL?

PostgreSQL is one of the oldest and best-developed object-relational Open Source database systems, and allows successful implementation of ISO SQL2003 standards. Thanks to its excellent stability and scalability, PostgreSQL is becoming more and more popular for business. From a technical point of view, PostgreSQL is a complete replacement for proprietary database systems.

Is PostgreSQL really free of license fees?

Yes. PostgreSQL is freely available under the BSD Licence, allowing its use arbitrarily across your business.

Can I reduce costs by using an Open Source database like PostgreSQL?

Absolutely. Even if all the expenses of integration and migration are taken into account, you can run a high-end database system with PostgreSQL. The total costs usually account for just a fraction of the licence fees which you would have to pay for proprietary databases.

Does PostgreSQL offer the same security as proprietary databases?

Certainly. An international team has been developing PostgreSQL for more than 15 years, and the development continues constantly. PostgreSQL has already been installed more than a thousand times, and is used successfully in many international enterprises, and in the public sector.

Is support for PostgreSQL as good as for proprietary database systems?

Yes. Leading PostgreSQL developers and experienced administrators at credativ's Open Source Support Centre offer comprehensive service and support for PostgreSQL and all Open Source software. Credativ offers the high-level assurance and support levels around the clock, 24 hours a day, seven days a week.
